Animal genetics – health, behavior and welfare, was held on site at campus. Out of 20 enrolled students 19 proceeded through the course, with 13 (68%) providing written course evaluation. An additional oral course evaluation was held with the students on the final day of the course. In general, the course evaluation indicated a good impression of the course (median score 4 out of 5). However, some students (5 out of 13 in the report) had an overall poor impression, which, of course is of concern. A majority of the students followed all deadlines, while the presence on non-mandatory lectures and exercises were sometimes low. The course included a lot of assignments and deadlines, which required the students to plan their work already from the start of the course. Based on the fact that students come from diverse educational backgrounds, basic lectures were provided in the beginning of the course to refresh some prior knowledge in *i.e.* genetics/animal breeding and statistics/mathematics. Some students still indicate in the evaluation that they did not have adequate knowledge for this course, which may partly explain some of the low remarks in the evaluation of the course?

Four case studies were rotated among the students during the course. The groups for these cases are decided by the teachers prior to the course start, based on provided information of previous background in breeding, genetics, welfare and ethics. The students pointed out that it was good that the background of the students was balanced in order to support discussions on all targeted steps in the cases, but some students still struggled with group dynamics that may have had a negative impact on their experience from this assignment. In the evaluation report information about how to provide constructive feedback was requested, which is a good suggestion to consider and add for the course next year.

One of the topics that stood out this year was negative comments on the experience regarding the instructions for the computer exercises. These instructions have not changed and did not attract negative comments last year. Some of the difficulties may be that some students did not attend the exercises on the scheduled time, and even if a follow-up was arranged few attended. The computer exercises are not mandatory, which some students suggested they should be. For next year it may be good to re-evaluate the instructions, but also to emphasize early on to the students that attendance to scheduled exercises are often helpful.

An individual project is included in the course, where the student plans a scientific study and write a research application on a topic of their own choice. The overall impression of the assignment was positive, even if some struggled with feedback from supervisors and understanding the task at hand. Based on feedback from previous year a lecture on how to write a research application was planned, but unfortunately was not provided to the students this year. This will be included next year and may help overcome some of the observed difficulties with the individual project this year?

Another comment from previous years evaluation was the request for a lecture focused on methods in molecular genetics. This was added this year and was highly appreciated by the students. The students said it supported them in understanding part of the work with the case studies, but they also asked for the possibility of adding even more in-depth information. The lecture will be kept in the schedule for the next course, based on the students' positive feedback.
